Closing the Gender Gap in Education: Making a Difference in Math and Science Education, An Ethnographic Study

By Dr. Valjeaner Ford, Ed.D

Even though women make up nearly 60 percent of college students, ingrained sexism and gender roles continue to hamper K-12 schooling for both boys and girls. Gender-based stereotypes are, in part, why females have previously not been encouraged to take STEM classes or engage in STEM projects, majors, and career fields.

Purpose & Objectives
- To examine secondary school students’ perspectives of STEM subjects in high schools.
- To use focus group questionnaires to gain insight into the courses that high school students deem engaging and appealing.
- To consider the students’ first introduction to STEM courses, as well as the students’ past and present attitudes toward STEM courses.

Literature Review
- Whitmire and Bailey (2010) explain that over the past 20 years, “discussions of gender equity have fallen into an either/or paradigm in which one group of students has been singled out as the only group needing attention.”
- Research indicates that “When you examine state tests…you see that girls have pulled even with boys in math and science. In some cases, they outscore boys in those subjects” (Whitmire & Bailey, 2010).

Methods
Researchers engaged in a systematic study of the males and females at two rural high schools in North Carolina using focus group questionnaires. Throughout the study, students’ identity remained anonymous; the only demographic information that students were asked to provide was their self-identified gender.

Steps in Gathering Data:
1. Researchers physically visited each high school.
2. Researchers met with administrators to gain insight in current trends in closing the gender gap.
3. Researchers visited each math and science classroom to gather focus group questionnaires written responses.

Participation
839 Students from two Sandhills Region 4 high schools in North Carolina participated in the research study:
- School A (rural): 90 self-identified females, 91 self-identified males, and 1 self-identified as Other participated in the study.
- School B (urban): 312 self-identified females, 338 self-identified males, and 7 self-identified as Other participated in the study.

Do you think that you will get into a good college and major in an area needed for a career in science, technology, engineering, or math, why or why not?

Discussion
- Females are as likely as males to be interested in STEM content areas throughout the secondary academic years.
- Educators and educational administrators must continue to reinforce the value of females taking science, technology, engineering, and math courses throughout the high school years.
- Current educators, as well as future educators in teacher education programs, need to be cognizant of the fact that some students are not being told about the acronym STEM.
- Students need to be told what STEM means or students will not be aware of their own personal interests in STEM fields.

Do you believe you need to be more like a boy or a girl in order to succeed in STEM fields?

School A Males ranked math as the highest, but science was the most prevalent response for second highest in importance. Following math and science were engineering and technology.

Once again, about 25% of the students claimed that English was more important than at least one of the STEM content areas.

School B Males: Math ranked highest, with engineering and technology as the second most common in importance.

Do you think that you will get into a good college and major in an area needed for a career in science, technology, engineering, or math, why or why not?

Rank the order of importance of Science, Technology, Engineering, and Math. Do you prefer English or Social Studies courses better than Math or Science?

School A Males: Science classes were the most important, but instead of following science with technology, engineering, or math, the females actually stated English was a close second to science courses.

About 25% of the female students at School B remarked that all of the courses were essential to learning and thinking and not a particular area.

School B Males: Math ranked highest, with engineering and technology as the second most common in importance.

Science ranked fourth for the majority of males, but some males ranked science as the most important.

7 males remarked that English was the most important or of equal importance to the STEM courses.

Note: Blue indicates not sure/undecided.

Results

- Were you introduced to STEM fields in elementary, middle, or high school?
  - Yes
  - No

- Subjects are likely to impact on STEM career awareness throughout the educational journey.
  - Math
  - Science
  - Technology

- Students need consistent exposure to STEM concepts to increase career awareness.
- Early exposure to STEM can increase career awareness among female students.
- Teachers must continue to encourage female students to pursue STEM careers.
- Early exposure to STEM can increase career awareness among female students.

- Students need consistent exposure to STEM concepts to increase career awareness throughout the educational journey.
- Early exposure to STEM can increase career awareness among female students.
- Teachers must continue to encourage female students to pursue STEM careers.
- Early exposure to STEM can increase career awareness among female students.
